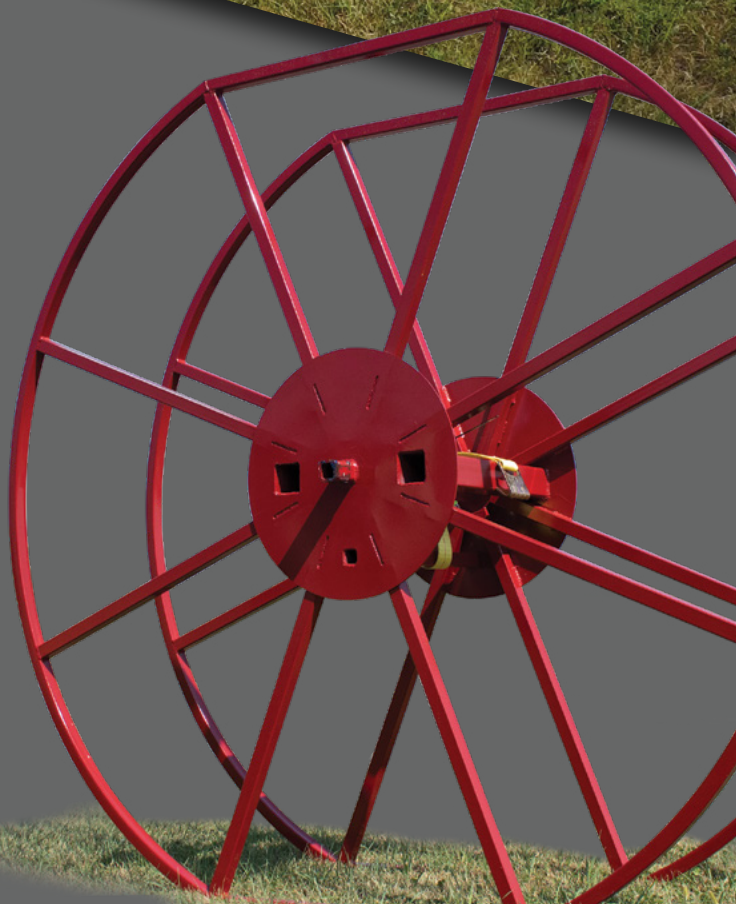
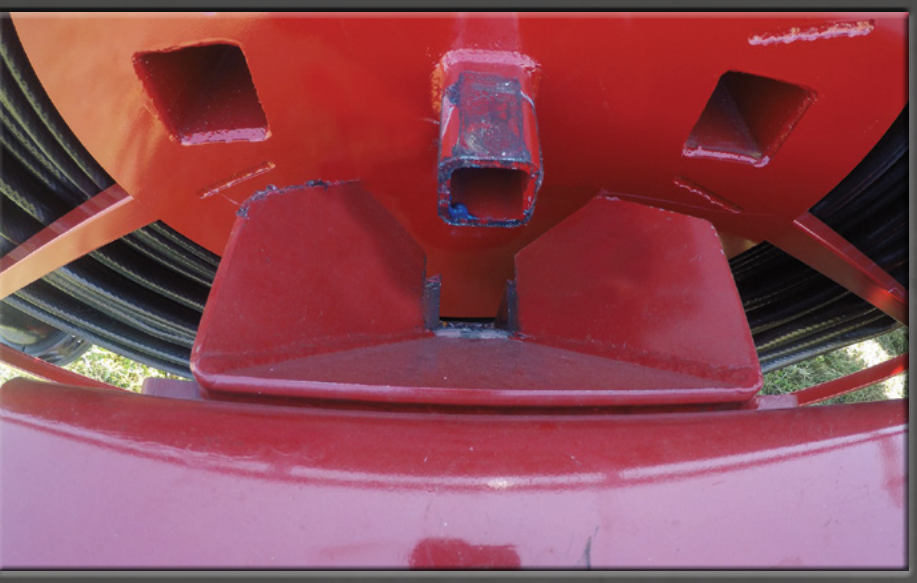
Salus Deployer

SALUS [sey-luh s]

Latin : Safety & Welfare

- Safety is the key feature behind the Salus deployment unit.
- A removable coupler guard can be attached to the guiding arms for extra protection for the operator
- The spool is designed to wrap up to a 12” polyurethane layflat hose.
- Designed for easy pickup and removal of reels on any type of terrain.





CRADLE GUIDE

The Salus deployer is designed for an operator to easily guide the reel into the guide arms as easily and as quickly as possible.

The cradle guides are wide enough to allow the reel to always fall into place even if the operator is off target by a few inches.

HOOK PICKUP

Using something as simple as a hook strap connected to the reel, the operator can pickup and start spooling hose without leaving the cab of his or her skid steer.

This will also allow the operator to place the hose back down gently when unspooling protecting the hose and coupler.

STATIONARY OR ON THE MOVE

The Salus deployer allows for the operator to decide what works best for them when it comes to wrapping up hose.

The operator can stay in one spot while bringing the hose to them or continue to move with the hose and pick it up on the go.
